

1 · Monorepo — a folder decision, nothing more

Many projects, one Git repo.
Atomic commits · one history · grep-able

eng-labs-monorepo/
7 apps · 8 packages · 8 cloud functions

2 · Workspace — link local projects, one per language

Symlinks local folders so they can
import each other; one lockfile

pnpm-workspace.yaml + pnpm-lock.yaml (JS)
pyproject.toml + uv.lock (Python)

3 · Task runner — which scripts, what order, skip if unchanged

Derives build order from the
dependency graph; caches outputs

Turborepo · turbo.json
dependsOn ^build · outputs · env

4 · Scripts — do the actual work

Compilers, bundlers, linters,
test runners

tsc · next build · prisma generate
jest · eslint · uvicorn

Each layer is replaceable. Swap pnpm for npm and Turbo still works.
Delete Turbo and pnpm still links. Delete both and it is still a monorepo.
