

CLAUDE.md — repo-wide, ALWAYS loaded
naming · commit format · domain language · gates
(cheap, broad orientation for everyone)

SKILL (backend / frontend) — loaded ON DEMAND
RLS · decorator registry · auth-event schema · state machines
(deep, domain-specific — single source of truth)

↑
|
/ references (does not copy)

AGENT (be-dev ...) — role / behavior ONLY
what this worker does + returns; points to the skill

Rule of thumb: invariants of the code → SKILL (deep) or CLAUDE.md (broad) what a worker does → AGENT
